Hatzenbuhler N.T., Nulf S.C.;
"Cloning and sequence analysis of the gene encoding invertase from
"Cloning and sequence occidentalis.";
Curr. Genet. 16:145-152(1989).
-!- CATALYTIC ACTIVITY: Hydrolysis of terminal non-reducing beta-D-
fructofuranoside residues in beta-D-fructofuranosides.
-!- SIMILARITY: Belongs to family 32 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Debaryomyces occidentalis (Yeast) (Schwanniomyces occidentalis).

Globes was musculus (clone XR6-1) - mouse (fragment)
Closecies: Mus musculus (house mouse)
Closecies: Mus musculus (house mouse)
Closecies: Mus musculus (house mouse)
Closecies: Made. 177, 797-809, 1993
A,Title: Hypermutation is observed only in antibody H chain V region transgenes that have do for somatic mutation.
A,Reference number: PH1482; MUID:93171820; PMID:8436910
A,Recession: PH1480
A,Status: translation not shown
A,Status: translation not shown
A,Status: L-102 <GIU>
A,Astatus: L-102 <GIU>
CSUD-Affamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ig heavy chain V region (clone XR26-3) - mouse (fragment)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.

Claim 27; SEQ ID NO 24903; 487pp; English.

The present invention relates to human single exon nucleic acid probes (SENP: see AA110068-AA120459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Heid cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and diaplaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide #7950 encoded by probe for measuring placental gene expression.
                                                                                                                                                            Gaps

                                                                                   measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nuclectide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent dees not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                               The invention relates to a single exon nucleic acid probe (SENP) (1) for

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 27; SEQ ID NO 33269; 634pp; English

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from the man lung comprising single exon nucleic acid probes having one of 12614 mucleic acid sequences meating frames derived from the 12614 to proper sing frames derived from the 12614 mucleic acid sequences meating frames derived from the 12614 mucleic organization, or their complements or the 12387 open reading frames derived from the 12614 mucleic acid sequences which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample act derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a enkaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the existaryote; and (b) detecting specific hybridisation of detectably, labeled nucleic acids from euwaryote lung mRNA, to a single exon probe, having a framement identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, above and (b) measuring the expression of each of the exons in the transportation of a single gene, above and (b) measuring the expression of the exons should be assigned to a single gene; a petide comprising one of the exons should be assigned to a single gene; a petide comprising one of the exons should be assigned to a single gene; a petide comprising one of the exons should be assigned to a single gene; a petide comprising one comprise, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human analysis, and for the study of lung disease (ORP), interstitial lung disease (Lilbor maniforme, fishocopes/open reading frames (ORP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel polynucleotide (I) (and complements and hybridizable polynucleotides) comprising a contiguous nucleotide sequence coding for a human antibody with factor VIII specificity which has hemostatic activity. (I) is useful a primer or probe for detecting the presence of inhibitory antibodies directed against factor VIII. The polypeptides of the invention and the antibodies generated from them are useful in compositions for neutralizing factor VIII inhibiting antibodies in hemophilia A patients. This sequence represents the human factor VIII antibody A3-C1 specific scFv protein DP-15 which is used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide, polypeptide and antibody useful for diagnosing the presence of neutralizing antibodies against factor VIII and for treatment of hemophilia A patients with these antibodies.
present sequence is a peptide/protein encoded by a single exon probe the invention. Note: The sequence data for this patent did not form pot the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scrv) or a disulfide Fv (dsrv). The peptide, optionally in association with or attached, coupled, combined, linked or fueed to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region related peptide of the invention

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigan-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful from inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restencisis, growth and/or replaced and/or rell-cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet platelet and/or cells in cease in number of tumour or leukaemia cells increasing the susceptibility of diseased cells to deareading the number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to deareasing the number of tumour or leukaemia cells, for increasing the susceptibility cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for dispossing and treating diseases nuch as cancer, leukaemia, autoimmune diseases, inflammatory diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function interesting and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function interestin
                                                                            metastasis; hypervariable region; autoimmune disease; thrombosis; restencess; ludkaemia; inflammatory disease; acatdovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, for treating autoimmune, inflammatory or cardiovascular diseases, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mar-Haim H;

The invention describes a method of making a humanised antibody, comprising making chimeric antibodies containing a complementarity comprising making chimeric antibodies containing a degramation of determining region (CDN) from a non-human antibody and appropriate framework sequences (I) of human antibodies. (I) is selected by using canonical CDR structure types of non-human antibodies as the basis of canonical CDR structure types of human antibodies as the basis for selection, for humanisation. The method is useful for making a to an interpret of any subject species to a less immunoganic form suitable for use in an object species. The method is reliable for identifying suitable human framework sequences to support non-human CDR regions and to provide humanis antibodies that retain this antigen binding with two immunogenicity in humans, without the need for determining critically important amino acid residues in the framework and without the need for multiple iteration and construction to obtain humanised antibodies with suitable therapeutic properties. The antibody has high affinity and low immunogenicity without need for comparing framework sequences between non-human and human antibodies. This sequence framework sequences between non-human and human antibodies. This sequence represents a human heavy chain variable region gene segment used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                            Making humanized antibody for converting antibody, by making chimeric antibodies containing complementarity determining region from non-human antibody and appropriate framework sequences of human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

rythiutuura aintivutes inave beein produced with Egypen Ceils of Embry compuse that had received multiple injections of mercuric ions reacted with compuse that had received multiple injections of mercuric ions reacted with glutathione to produce a mercuric ion coordinate covalent compound which was covalently bound to keyhole limpet hemocyanin (KIAI). Eight hybridomas (CIFIO, 4AIO, 1CII, 5G4, 23F8, 2D5, 5B6 and 3EB) were producing Mabs that cover strongly positive against glutathone without mercuric ions. RNA was isolated from hybridoma cells with ganidine isothiocyanate. First strand cDNA synthesis was catalysed by Mulv reverse transcriptase. The primers used for conna synthesis were complementary to the 5' end of the CH1 domain of the cappa domain. Some of the brimers used for cDNA synthesis are shown in AAQ97511-Q97518. The primers used for cDNA synthesis of the CK kappa domain. Some of the brimers used for cDNA synthesis of the CK wariable region of a particular antibody polypeptide was also used for cPCR amplification of that variable region, in conjunction with an copropriate V-region primer. In addition, the VH primer AAQ97518 was used to amplified mucleotides were determined. These are given in AAQ97518 was used to amplified mucleotides were determined. These are given in AAQ97518 cand the deduced AA sequences in AAR79241-R79250 & AAR78970-R78971. The descriptions of the SEQ ID nos given on pp 44-45 and in the claims are deferent from the descriptions in the sequence listings are used here. (Updated on 25-MAR-copy to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide(s) which bind heavy metals, esp. mercury - derived from monoclonal antibodies, used for detecting, removing, adding or neutralising heavy metals.
Monoclonal antibody; heavy metal; mercury; variable region; heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibodies have been produced with the spleen cells of BALB/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to a chimeric antibody, derived from a monoclonal antibody, which recognises N-glycosylated gangliosides and is produced by hybridoma ECACC 9413026. The chimeric antibody, and similar antibodies derived from the anti-idiotypic monoclonal 1E10 (recognising P3) are used for treatment, localisation and in vivo identification of breast cancer and melanoma, their metastases and relapses, tumours of lung, digestive and urogenital tracts, and sarcoma and tumours of neuroectodermal origin. This sequence represents a protein relating to the chimeric antibody of the invention
                                                                                                                                                                                                                                                                                                                                         diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein sequences (AAR66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (AAQ78939-97002) ware isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y5, Y24; 3-31; M64; M118 and M131, Dy DCR amplification using primers AAQ78917-38. The genes are subdivided into 5 families of Vh genes. The fragments over a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TaqI restriction enzyme. The fragments were peparated by gel electophoresis and 35-45 kb fractions were collected. The fragments were ligated with clar-digested cosmid vector DNBH. The fragments were ligated with clar-digested cosmid vector DNBH. The fragments were in vitro packed and infected into E.coll 499A. The fragments were buckloned by colony hybridisation. The Vh genes and the DNA fragments encoding them are useful in producing human mammalian hosts. (Updated on 25-WAR-2003 to correct PN

```
The invention relates to a chimeric antibody, derived from a monoclonal antibody, which recognises N-glycosylated gangliosides and is produced by hybridoma bcAcc 94113026. The chimeric antibody, and similar antibodies derived from the anti-idiotypic monoclonal 1810 (recognising P3) are used for treatment, localisation and in vivo identification of breast cancer and melanoma, their meteastases and relapses, tumours of lung, digestive and urogenital tracts, and sarcoma and tumours of neuroectodermal origin: This sequence represents a protein relating to the chimeric antibody of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides the protein and coding sequences for the variable regions of human monoclonal antibodies which are immunoreactive with human immunodeficiency virus-1 (HIV-1) envelope glycoprotein gpl20. These can be used in diagnosis and therapy of HIV-1 infection
                                                        New chimeric antibodies, useful for treatment, prevention and diagnosis of tumors that express gangliosides, are derived from monoclonal antibodies P3 or 1810.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human monoclonal antibody immunoreactive with human immunodeficiency virus-1 glycoprotein gpl20, useful for detecting in biological sample and providing passive immunotherapy to HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human immunodeficiency virus-1; HIV-1; human monoclonal antibody; envelope glycoprotein; gp120; diagnosis.

New specific binding agents (i.e. anti-Angiopoietin-2 antibodies), useful for inhibiting undesired angiogenesis, or treating e.g. cancers, obesity, hemangioma, arteriosclerosis, atherosclerosis or endometriosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to angiopoietin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired angiogenesis, treating cancers, inhibiting undesired angiogenesis, modulating or inhibiting the activity, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocular neovascular disease, obesity, haemangioblastoma, haemangioma, arteriosclerosis, inflammatory disease, inflammatory disease, inflammatory disease, or psoriasis) in a mammal. The present sequence represents a heavy chain variable region of an anti-Ang-2

The invention relates to a chimaeric molecule comprising the GD3
(ganglioside antigen) binding domain of antibody MB3.6, with any of 3
variable gene sequences, or the PSMA (prostate-specific membrane antigen)
binding domain of antibody 3D8, 4D4 and 3E11, with variable gene
sequences, the zeta signalling chain of the T cell receptor and an
indicate molecules expressed in which cysteine residues have been mutated.
The chimaeric molecules expressed in the T cells or NK cells or other
effector cells are useful in treating patients with cancers expressing
the GD3 (MB3.6 derivatives) or PSMA antigen (3D8, 4D4, 3E11 derivatives),
and/or together with each other or with heterologous constructs to engage
additional stimulatory and functional properties of the effector cells to
enhance the antitumour therapeutic efficacy (claimed). They are
tumours and prostate and small cell lung cancer. The present sequence
tumours and prostate and small cell lung cancer. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
